

Temperature proxy diagnosis

Mean SHAP rank across 2 models x 3 targets; D/E average five N=175 subsamples

Evidence checks

1 Sample-size control: D vs B

D #4.1 ~ B #3.8 -> smaller N does not restore dominance

2 Data-source control: D vs A'

A' #1 -> D #4.1 at same N/features -> source structure

3 Proxy check: add Cl2 dose

With Cl2: Cl2 #2.1, Temp #4.8 -> proxy resolved

Conclusion: multi-system data dissolves the temperature-confounding signal.
